

Needfinding

Human Computer Interaction

Catia Prandi
catia.prandi@unibo.it

Hall of Fame or Shame?

A mix: it depends on the type of target using it

<https://www.youtube.com/watch?v=e2RoNSKtVAo>

Google Nest Mini: Issues

“Tap” is not for activating it!!

Play & pause

Tap the center of your Nest Mini

Change volume

Tap the right or left side to change volume.
When something is playing, the lights will turn on as your hand gets close.

Mic switch

To turn off the mic, slide to show orange.
The lights on top will also turn orange.

Others
issues??

Possible solutions to the "problems"

- An easier word to activate it
- More tangibility – activate it by touch
- Better onboarding – to learn how to use it
- Possibility to “learn” –es. singing a song for recognition

You need to understand the target of the product and the needs of the target

Goals

- ~~Individuare e definire i~~ Finding and framing problems, starting from people
- Understanding the system requirements and user needs
 - “Needfinding” Needfinding = Problem framing + understand what people need
- ~~metodi~~ Knowing tools and instruments for Needfinding

- Problem solving: you have a problem and you find a solution to the problem
- Problem framing: understand the problem (not finding the problem: Problem finding)

Human-Centered Design Process

Il compito di chi fa Needfinding non è chiedere agli utenti quale soluzione vogliono (perché spesso risponderanno basandosi solo su ciò che conoscono), ma osservarli e interrogarli per estrapolare il vero bisogno sottostante (il Need).

La differenza tra un Need (Bisogno) e un Want (Desiderio o Soluzione richiesta) è fondamentale:

- 1) Want: È ciò che l'utente dice di volere o la specifica soluzione/prodotto che immagina di usare. I want sono solitamente formulati come sostantivi o prodotti specifici. Il problema: Gli utenti non sono progettisti o esperti di tecnologia; tendono a esprimere desideri limitati dalla propria esperienza passata o dal contesto attuale.
- 2) Need: È la necessità fisica o emotiva fondamentale, la lacuna nel sistema o l'obiettivo sottostante che l'utente cerca di raggiungere. I need sono espressi tramite verbi (es. "ha bisogno di un modo per fare X" o "deve poter fare Y")

What Are Needs?

You need to write it down for the final project: you will find different needs from different people (usually, is not one person need, but you need to find the common needs between the people interviewed)

Definizione di Need

- “Human emotional or physical necessities” →

Gaps (gulfs) of Norman model

- “Gaps in a system” →

C'è un divario (gap) tra ciò che l'utente vuole/deve fare e ciò che il sistema attuale (o la situazione attuale) gli permette di fare.

Significa che un Need è uno stato di necessità della persona, che può essere:

- Fisico/pratico: la necessità di ridurre lo sforzo, il tempo, la fatica o l'incomodità (es. muoversi più velocemente, leggere senza sforzare la vista).
- Emotivo/psicologico: la necessità di sentirsi sicuri, in controllo, appagati o non frustrati durante l'uso di un sistema.

Mentre il gap è il problema nell'ambiente/sistema, questa definizione indica il disagio o la necessità reale provata dall'essere umano.

- They are **verbs**: activities and desires with which your user could use help

- not nouns (solutions) Need something (solution that there isn't) to do this (that is the need)

- Often, it is helpful to use the phrases ‘needs a way to’ or ‘needs to be able to’ to describe user needs

- They emerge directly from user ~~traits~~^{caratteristiche} or from contradictions between two

~~caratteristiche~~
~~traits~~

- such as a disconnect between what they says and what they do

"user traits" indica l'insieme di qualità fisiche, cognitive, demografiche e comportamentali che definiscono chi è l'utente.

Quando fai Needfinding, devi spogliarti dalle tue idee preconcepite, dalle tue ipotesi su quale sia il problema e da come vorresti risolverlo. Se entri in fase di ricerca avendo già in mente una soluzione (o un'idea di bisogno molto specifica), finirai per guidare l'utente verso la risposta che desideri tu.

A story...

If I had asked people what
they wanted = solution; need = move faster wanted, they would
have said faster horses.

Henry Ford

So...

- Is a faster horse a need???

So...

- Is a faster horse a need???
- NO! (there is no verb..!)
- It is a solution!! (and it is also a “want”)
- So.. Which is the **need**??

So...

- Is a faster horse a need??
- NO! (there is no verb..!)
- It is a solution!!
- So.. Which is the need??
– Moving faster! (verb..!)
- So.. Why horses?
– Because people know that!! Their experience is on that!
– Note that cars are not the only solutions..! Different ways to solve the same needs
– And this will happen to you as well!! Since they are going to talk about what they know! What they experienced! They are going to tell you about “their horses”

You need to find the needs of the target, then you will find the solution with your own problem solving

What is Needfinding?

Sono i gaps (gulfs) del Norman model

- Needs: gaps in a system
- Needfinding: discovering opportunities by recognizing this gaps

What is Needfinding?

So, Needfinding and then create the solution to solve the need

- Figure out the story of **what** and **why**...
- ... and tell a new one!

Very important!!

- **Needfinding means finding the needs, not the solutions!!**

Prima di iniziare il Needfinding ti servono:

- un dominio di interesse: definire la macro-area su cui vuoi indagare (es. "la fruizione dei trasporti pubblici" o "lo studio in biblioteca").
- un'ipotesi iniziale per il reclutamento: una guida generale per sapere quali persone iniziare a contattare o quali ambienti osservare per primi.

Cosa cambia prima e dopo il Needfinding:

- PRIMA: Le risposte a Who, How e Context sono semplici ipotesi lavorative necessarie solo per perimetrare la ricerca.
- DURANTE e DOPO: Quelle domande diventano il tuo strumento di indagine per raccogliere dati reali, validati ed emergenti dal campo.

Iniziare credendo di avere già le risposte significa cadere nella trappola delle assumptions e rischiare di progettare per dei preconcetti anziché per i reali bisogni dell'utente. La fase di Needfinding (tramite osservazioni e interview) serve proprio a verificare, correggere o ribaltare queste supposizioni di partenza trovando la realtà dei fatti.

Main Needfinding Questions

- **Needfinding = Finding Potential User Needs**

Il Needfinding non serve a inventare prodotti, ma a scoprire opportunità nascoste identificando ciò di cui gli utenti hanno davvero bisogno prima ancora di progettare.

- **What do users need?**

farsi queste domande prima è indispensabile per inquadrare il progetto, definire il team e scegliere la direzione. L'importante nel Needfinding è considerare le risposte iniziali come delle ipotesi di partenza che vanno poi confermate, smentite o arricchite dall'osservazione diretta degli utenti reali.

- **That also requires**

Devi definire le loro caratteristiche specifiche

(the target depends on the macro idea that you have as project)

in the domain

the smaller it is the target, the easier will be to understand their need

- **Who are the users?** (age, capabilities, background, experts, etc.)

Devi studiare il loro comportamento e le loro abitudini attuali.

- **How are they doing it, now?** (es. Commuting.. How? Buses? Trains?

Single Ticket? Subscription? etc.)

Esempio della slide (Pendolarismo): Come viaggiano oggi? Prendono il bus o il treno? Usano biglietti singoli o abbonamenti? Usano app o biglietti cartacei?

L'ambiente e la situazione cambiano radicalmente il bisogno.

- **What is the context in which they are doing it?** (es. tourists, eramus students, etc.)

Un turista straniero che deve prendere il bus a Bologna ha bisogni diversissimi da uno studente Erasmus o da un residente che fa quel tragitto da 5 anni.

- **Can't we just ask them?**

We will ask but before we need an idea as project team and then ask them structurely

- Hypothetically yes.., but.. the results could be confusing.. Too vague -- **We need a more structured process!! -> needfinding!**

→ Gli utenti non sanno esprimere i propri bisogni in modo razionale e tendono a chiedere solo "soluzioni" che già conoscono (devi aiutarli a trovare una soluzione)

La maggioranza di utenti che intervisti sono gli "standard users" per capire il comportamento tipico, ma intervisti anche utenti "imperfetti", non-utenti o casi limite perché sono loro a farti scoprire i bisogni più nascosti e le criticità più profonde del sistema.

«Know Your Users»

Know Your Users (1)

Invece di fare centinaia di interviste superficiali a persone a caso, il Needfinding punta a condurre indagini in profondità con un numero limitato ma selezionato di utenti rappresentativi (representative users).

- Who are the users of the system?

- Uniform, or different categories/groups?
- Young/old? Novice/experienced?
- Do not think of "generic" users, split the categories

suddividere l'insieme degli utenti in sottogruppi specifici e distinti, in base alle loro caratteristiche.

- ***You*** are not a [representative] user

If you find a problem in a domain, you need to confirm it with people (you don't have to solve your problem but user problem)

- Designers and developers' skills, knowledge, attitude, background, interests, ... are totally unlike those of your users
- Except by chance (e.g., you are also students, developers, ...)

si intende chi ha commissionato il lavoro

- The **client** is not a [representative] user

- Bosses, managers, directors, ... believe they know their employees and their jobs. Actually, they don't
- Always seek the actual users that will use the system

It is costly and takes time

Know Your Users (2)

■ Talking to users

- **Surveys** (send around to get more and specific data, less direct)
- **Interviews** costly and take a lot of time (we will focus on this)
- **Direct involvement (participatory design)** we will not doing it: takes a lot of time (user inside the process). Generally, It is done with a very specific target
- Bypass corporate policies
- Understand real current behavior, pain points, workarounds, ...

■ Watching users we will not doing it

- **Observation sessions**
- **Video recording (and analysis)** privacy issues
- **Diaries** analyse the notes taked
- **Analyze their work** (artifact, processes, action sequences)
- **Discuss with users the findings of the observation** (may discover the “why”)

Co-design (workshop of 2 hours with target): similar to participatory design (users design the product and you get the artifacts created)

Know Your Users (3)

- **Imagining users** You need to be an expert to use these methods
 - When real users are not available
 - Imagine how a real user would behave (**very difficult**) Imagine the behaviour of users (target)
 - Building “imaginary” users: **personas** → 5/6 personas (standard users + users with special characteristics)
 - Detailed description of hypothetical persons in a given role
 - Imagine them as they were a real person

You can combine the methods (e.g. personas + interviews)

Problem Framing

Perché se ti limiti a trovare un problema (Problem Finding) ma non lo inquadri correttamente (Problem Framing), cioè rimani in superficie e non vai in profondità per capirlo veramente, rischi di progettare la soluzione perfetta per il problema sbagliato.

Comprendi il contesto reale e i bisogni profondi: Cerchi di capire la situazione a 360 gradi prima di saltare alle conclusioni o proporre soluzioni.

- Framing problems is as important as finding them
 - we need to check our and other people's assumptions to fully understand the needs, the context, and emphasize with them
- For example, let's say that a person shows this to us:

$$4 + 4 =$$

Verificare le supposizioni: Metti in dubbio ciò che tu, il tuo team o il cliente date per scontato. Chiediti sempre: "Stiamo dando per scontato qualcosa che in realtà non è vero per l'utente?" (come nell'esempio $4 + 4 =$, dove diamo per scontato che siano numeri aritmetici).

Empatizzi con le persone: Ti metti nei panni dell'utente per vedere il mondo dal suo punto di vista e percepire i suoi reali stati d'animo.

Problem Framing

- Framing problems is as important as finding them
 - we need to **check our and other people's assumptions** to fully understand the needs, the context, and emphasize with them
- For example, let's say that a person shows this to us:

Senza Problem Framing: Vedi $4 + 4 =$ e la tua mente assume subito che si tratti di un'addizione aritmetica, per cui concludi che il problema sia trovare la somma (8).

Con il Problem Framing: Ti fermi e metti in discussione le supposizioni (check assumptions).

In sintesi, il Problem Framing è l'atteggiamento mentale di non dare mai nulla per scontato e analizzare i fatti senza i propri pregiudizi.

A handwritten equation consisting of the number '4', followed by a plus sign '+', another '4', and an equals sign '='. The characters are drawn with a single continuous stroke for each '4' and the plus sign.

Assumptions!!!

You assumed that those characters are numbers, and the plus is the arithmetical sum.. But.. You don't actually know!

Problem Framing

- Framing problems is as important as finding them
 - we need to **check our and other people's assumptions** to fully understand the needs, the context, and emphasize with them
- For example, let's say that a person shows this to us:

$$4 + 4 =$$

Questions should be:

- Are those numbers?
- Are those symbols in the arithmetical domain?

Problem Framing

- Framing problems is as important as finding them
 - we need to **check our and other people's assumptions** to fully understand the needs, the context, and emphasize with them
- For example, let's say that a person shows this to us:

A handwritten equation: 4 + 4 = 3. The numbers and the plus sign are drawn with a single continuous stroke, making them look like a single connected shape. The equals sign is drawn with two horizontal lines.

You need to be very careful!!
Assumptions can *break* your
needfinding process!

Needfinding Methods

Techniques adopted in Needfinding and Requirement Analysis

Many Methods!

- Observations
- Diaries we will not use them here (but it can be useful)
- Interviews
- Focus groups Similar to co-design; we will not use them here (but it can be useful). Can be used at the beginning or during the process. Start discussion with people, show the prototype and get feedbacks
- Surveys
- Contextual Inquiry

To Get Started...

Can be used for whatever needfinding method

For us, is the interview

After having identified and found the users to *<insert needfinding method>*:

and yourself

1. Introduce yourself and try to make the participant comfortable.
2. Discuss confidentiality and get *explicit consent* for any filming or recording you may be doing.

(the users need to be able to quit the interview, if they are no more comfortable: must be said at the beginning)

1. We need to be compliant with EU *General Data Protection Regulation* (GDPR)

Interviewed consent can be

2. *Written Or recorded*

3. *For children, you need the signed consent from parents/legal guardian; the child still needs to give you the assent (interest in participating)*

(Why are you there?)

3. Begin to introduce the topic/goal you are interested in understanding.

Understand the need in a specific domain

For us, is the interview

4. Start *<insert here needfinding method>*.

Observation

“You can observe a lot, just by watching” – Yogi Berra

Ethnographic Observation

- Embed in the users' environment, culture, behavior
- Goal: to obtain the necessary data to influence interface (re)design
- Learn the language of users and their environment
- Listen and observe carefully
 - Sometimes ask questions and clarifications
- Audio-Video Record / Take Notes
- Risks:
 - Misinterpret observations
 - Disrupting normal practice
 - Overlooking important information

What Should Learn By Observation? (1)

1. What do people do now?
2. What values and goals do people have?
3. How are these activities embedded in a larger ecology?
4. Similarities and differences across people
5. Other types of context, like time of day

Especially tacit (unspoken) knowledge

What Should Learn By Observation? (2)

- Process vs. Practice
- Process: how things are officially supposed to happen, and are officially part of the training
- Practice: set of workarounds, practical tricks, information learnt from the field and from experience, etc., that are part of daily activities

How to Conduct User Observations
<https://www.interaction-design.org/literature/article/how-to-conduct-user-observations>

Types of Observation (1)

Controlled Observation, within a Lab environment

- **Easy to reproduce.** If you use a quantitative approach – easy to get similar results by repeating
- **Easy to analyze.** Quantitative data requires less effort to analyze than qualitative data.
- **Quick to conduct.** Recruitment may take a little time, the controlled observation is fairly fast to run.
- **The Hawthorne Effect.** The act of observation of how someone does something can change their approach to carrying out the task.

Types of Observation (2)

Naturalistic Observation: studying the user “in the wild”, less structured

- **More reliable.** When people use a product in real life – they are much more likely to encounter the frustrations (and benefits) of real life use than they are in a lab following a set of instructions.
- **More useful for ideation.** Qualitative research can generate lots of ideas for product improvement as it opens up possibilities that aren’t found in quantitative research.
- **Difficult to include a representative sample.** More expensive and time consuming to conduct, limits the reach of the research. Use this kind of research to create ideas and then test those ideas with other forms of research.
- **Difficult to make them replicable.** Problem with sample sizes and dependence on the observer.
- **Hard to manipulate external variables.** For example, if it’s raining when you observe your users working on a smartphone – their behavior is likely to be different to when it’s sunny. You have no control over the weather “in the wild”.

Blending In

- **Becoming part of the wall**
(Complete Observer)

- Avoid being intrusive or modifying behaviors
 - Avoid video-recording or interruptions
- Schedule time for discussing your observations

- **Becoming “one of them”, like a spy**
(Complete Participant)

- Undergo training process
 - Official information
 - Matter-of-fact information shared by co-workers
- Observe all the practices
- Validate your observations with the others

Data Collection

Subjective

- Impressions
- Ranking/ratings by users on different questions
- Written summary report
- Artifacts and “hints” in the workplace

Objective

- Anecdotes
- Critical incidents
- Observed errors
- Observed workarounds

Interviewing

Asking users about their needs and desires...

... what could possibly go wrong?

Main Forms of Interviews

- In-person interviews
 - Time-demanding, in-depth knowledge
 - Structured vs Unstructured
 - One-to-one vs. Focus groups
- Surveys
 - Fast, more superficial
 - Sets of questions with predefined possible answers
 - Paper-based or on-line

Beware!

- Users don't know what they want
 - Maybe subconsciously, but not rationally
 - They will tell what they think you like to hear
 - Especially for “new” products or “disruptive” technologies
 - They lack the creativity or the technical expertise to understand the new product
 - They take the current context for granted (e.g., required workarounds “because, yes”)

Stop Asking Users What They Want

<https://uxplanet.org/stop-asking-users-what-they-want-21e9ba646bce>

Choosing Participants For Interviews

- Representative of target users
 - [All] Stakeholders
- May be current users of a similar system
- Might also be the non-users (for a new product)
- Approximate, if necessary (with similar users)
- Incentives, motivations, small gifts

Executing Interviews

- Schedule a time and place comfortable for users
- Introduce yourself, explain your purpose
 - You are not testing them; they are helping you
- Begin with open-ended, unbiased, non-leading questions
- Ask the question and let them answer
 - Give enough time. The 2nd reply is often more interesting than the 1st.
- Follow-up with related questions. Deep dive into interesting points

Interview

<http://dlrtoolkit.com/interview/>

Guidelines For Questions

- Structured questions are easier to process, unstructured questions solicit more comments
- Open-ended questions, with follow-up discussion
- For quantitative questions (e.g., rate in a scale 1 to 5, such as Likert), always ask what they mean by “4”
- Aim at direct, concrete, specific questions that ask for detailed answers
- Use the language of the user
- Always try the question with a smaller (trusted) group, for debugging

Examples of Open-Ended Questions

- ‘Tell me about your typical day.’
- Tell me three good things about. .. ’ [always start with positive things!!]
- ‘and three bad things.’
- ‘What has gone wrong with the application recently? How did you cope?’
- ‘What else should we have asked about?’ [to conclude..]

Bad questions – To Avoid

- Is feature [x] important to you?
 - ‘Leading’ question [it implies that the activity is important and also avoid yes/no questions]
- What would you like in a tool?
 - User are experts in their domain, not expert in design
- What do you like in [x]?
 - Assuming question. Maybe he/she doesn’t like it [or he/she loves it]
- What would you do in a hypothetical situation?
 - Users cannot imagine the complete environment or an unusual situation

Bad questions – To Avoid

- How often do you do [x]?
 - Humans are very bad at estimating (and biased in the answers)
 - May obtain by log analysis (if an application already exists)
- Binary questions (yes/no)
 - Do not yield motivation
- ‘Tell me a story about you’
- ‘How do you reach the decision? Did someone decide without you? ...’
 - **Avoid suggesting possible answers.** Trust the question: ask it and wait in silence

a Tools for Research project | design by pixelliquid

Surveys

Requirements gathering through (on-line) surveys and questionnaires

On-line surveys

- Familiar, cost-effective, potentially reaching a very wide audience
- Results can be easily visualized and analyzed with statistical methods
- Should be very careful with setting the goal of the survey
 - First define what statistics and/or charts you need, then design the survey structure and questions

Risks in surveys

- Good for a shallow view over a large base of respondent, but not for a “deep” analysis
- Impossible to ask follow-up questions
- Biased data if questions rely on user’s memory or on “sensitive” issues (money, emotions, ...)
- Finding a representative target population
 - Stratification

Survey structure

- Declare the purpose of the survey and the expected time
- One or more sections with targeted questions
- Background information about the users
 - Limit “mandatory” fields to a minimum

Background information (examples)

- Background demographics (age, gender, origins, native language, education, income)
- Experience with computers (specific applications or software packages, length of time, depth of knowledge, whether knowledge was acquired through formal training or self-teaching)
- Job responsibilities (decision-making influence, managerial roles, motivation)
- Personality style (introvert versus extrovert, risk taking versus risk averse, early versus late adopter, systematic versus opportunistic)
- Reasons for not using an interface (inadequate services, too complex, too slow, afraid)
- Familiarity with features

Types of Questions

- Open-ended questions
 - Solicit specific motivation, to avoid too generic answers
 - Require methodology for analyzing the responses
- Closed-ended questions
 - Only one possible choice
 - **Ordinal** values: a scale of ordered possibilities (e.g., from 1 to 5)
 - **Nominal** values: alternatives, with no ordering relationships (e.g., city or department)

Measurement scales (1)

- Nominal scale
 - Predefined set of distinct (pairwise disjoint) classes. No ordering.
 - Example: Gender. City of residence. Course of enrollment. Preferred color. Room of your house.
 - Meaningful statistics: Counting. Frequency. Mode.
- Ordinal scale
 - Distinct classes, pre-defined ordering. No defined “distance” across the different values
 - Example: University scores. Preference (**Likert**). Stars. Thumbs up/down.
 - Meaningful statistics: Ordering. Median. Quartiles. Percentiles. Rank.

Examples of ordinal scales

How do you feel today?

- ☒ 1 – Very Unhappy
- ☐ 2 – Unhappy
- ☐ 3 – OK
- ☐ 4 – Happy
- ☐ 5 – Very Happy

How satisfied are you with our service?

- ☒ 1 – Very Unsatisfied
- ☐ 2 – Somewhat Unsatisfied
- ☐ 3 – Neutral
- ☐ 4 – Somewhat Satisfied
- ☐ 5 – Very Satisfied

Q. I take home-cooked meals to the office.

Answers:

Always	Often	Sometimes	Rarely	Never
--------	-------	-----------	--------	-------

Measurement scales (2)

- Interval scale (rarely used)
 - Numerical value, arbitrary zero-value, arbitrary unit of measure
 - Example: Date. Hour. Temperature.
 - Meaningful statistics: Mean (Average). Variance.
- Ratio scale
 - Numerical value, fixed zero-value, arbitrary unit of measure
 - Example: Duration of a task. Length of an object. Age.
 - Meaningful statistics: All (higher-order, geometric mean, ...)
- Absolute scale
 - Numerical (integer) value, corresponding to the cardinality of a set
 - Example: Number of employees
 - Meaningful statistics: All

Examples of ratio scales

What is your weight in kilograms?

- Less than 50 kilograms
- 51- 70 kilograms
- 71- 90 kilograms
- 91-110 kilograms
- More than 110 kilograms

Interval scale	<u>Temperature</u>	<u>Grade or IQ score</u>	<u>Opinion/percep- tion scale</u>
	0 degree		
	1 degree	0 score	0
	2 degree	50 score	1
	.	60	2
	100 degree	.	.
		100 score	100
Ratio scale	<u>Height</u>	<u>Weight</u>	<u>Income</u>
	0 feet	0 Kg	0
	2.5 feet	5.5 Kg	5\$
	5 feet	10 feet	10.5\$
	10 feet	50 feet	.
	.	.	100\$
	100 feet	100 feet	1000\$

Ordinal scales: Likert scales

- Ask for the level of agreement about a statement
- Extreme values are very rare to be selected
- An even number of levels prevents a “neutral” response
- 4-level: Strongly Disagree / Disagree / Agree / Strongly agree
- 5-level: Strongly Disagree / Disagree / Neither agree nor disagree / Agree / Strongly agree
- Numerical ranges: 1-5, 1-7, 1-9

https://en.wikipedia.org/wiki/Likert_scale

<https://www.simplypsychology.org/likert-scale.html>

Deepening... Likert scale *

- **Can Likert Scales be Treated as Interval Scales?—A Simulation Study**

<https://www.tandfonline.com/doi/full/10.1080/01488376.2017.1329775>

Levels of Measurement

Offers:	Nominal	Ordinal	Interval	Ratio
The sequence of variables is established	–	Yes	Yes	Yes
Mode	Yes	Yes	Yes	Yes
Median	–	Yes	Yes	Yes
Mean	–	–	Yes	Yes
Difference between variables can be evaluated	–	–	Yes	Yes
Addition and Subtraction of variables	–	–	Yes	Yes
Multiplication and Division of variables	–	–	–	Yes
Absolute zero	–	–	–	Yes

Warnings

- If possible, use two simpler questions instead of one complex one (separate the factors of interest)
- Avoid negative words in the question
- Biased questions solicit biased responses

Contextual Inquiry

Observing while interviewing

Contextual Inquiry

- Contextual inquiry = inquiry of context
 - *Context*: the research takes place in the users' natural environment as they conduct their activities the way they normally would
 - *Inquiry*: the researcher watches the user as she performs their task and asks for information to understand how and why users do what they do
- Participants are observed while they perform tasks **and** talk about what they are doing while they perform them
 - Observation mixed with interviews
- Participants take a more *active* role in leading their session, like a craftsman with their apprentice

Contextual Inquiry Vs. Interviews

- Interviews and surveys rely on the users' ability to recall and explain a process that they are removed from in that moment
 - People attempt to summarize their processes, but important details like reasoning, motivation, and underlying mental models are *left out* of this summary
 - Often you only obtain a superficial understanding of the users' approach to the activity
- However, people can easily talk about **what** they are doing and **why**, when they are doing it
 - You get to see the interruptions, superstitious behaviors, and illogical processes

Contextual Inquiry Vs. Observations

- Contextual inquiry works well for understanding **in-depth thought processes** of users
 - and the underlying structure of their activities
- Direct observation works better when:
 - The activity does not require in-depth thoughts, e.g., designing a standard e-commerce page
 - People cannot (or should not) be interrupted or distracted
 - Think at doctors in hospitals, for instance
 - In these cases, a valid option is an observation followed by an interview

Risks and Downsides (I)

- **Participants always go into “interview mode”**
 - Working and demonstrating while being interviewed is unfamiliar to most people
 - It can be easy for participants to begin summarizing their processes at the end
- **It is a show-and-tell of frustrations with the current solution**
 - Participants may feel you are looking for their feedback on all the problems with the system
 - However, the purpose of contextual inquiry is to understand people’s thoughts and work process, regardless of the solution

Risks and Downsides (II)

- **You introduce biases**
 - It is important to approach contextual inquiry objectively, without any preconceived notions or opinions about the subject matter
 - Go into the activity with an open mind, treating everything you learn with the same level of importance
- **You bias the user**
 - As you perform the contextual inquiry, it is possible that the participant may adjust their process to fit into the discussion or your interpretations
